

EASY SITE BUILDER INSTALL

Requirements:

- A PHP 3.0 enabled webserver

Super Easy install:

Unzip folders on a php-enabled server; edit inc\config.php; shout users "site's ready!!!"...

Easy install:

(you can check a full example on Install\Example\Sales)

- Unzip the .gz or .zip file you downloaded.
- Put the \www content on the root of your site (be careful on deleting any previous model you could have)
- Build the \txtdata directories with page-named-directories (if you use an underscore "_", leftword are not printed. This is for ordering purposes). Example for ascii-fanned people:

```
www---+
|
|+--- 1_Sales
|   |
|   |+--- 1_Information
|   |
|   |+--- 2_Representatives
|   |
|+--- 2_IS
```

- Put on each subdirectory a data.txt file. On each data.txt file, use <p>title</p> tags for subtitling and my simple tags (you must teach this tags to your users):

<padeplnk=www.google.com>Google now!</padeplnk> works exactly as Google now!
<padebsub=subdir/subsubdir>Sells department</padebsub> is similar to the above one, but does not include "http://", for linking to other subdirs.
<padepimg=image.jpg> works as
<padepdoc=document.doc>Report</padepdoc>

Example: on Sales subdir, you could have this files:

```
drwxr-xr-x  6 publico 544      4.0K nov 21 10:57 ./
drwxr-xr-x 10 publico 544      4.0K nov 21 11:16 ../
```

```

drwxr-xr-x  2 publico  544      4.0K nov 21 10:58 Information/
drwxr-xr-x  2 publico  544      4.0K nov 21 10:58 Representatives/
-rw-r--r--  1 publico  544      2.6K nov 17 16:15 data.txt
-rw-r--r--  1 publico  544      26K oct 23 08:54 evaluation.doc
-rw-r--r--  1 publico  544      3.6K nov 14 12:16 pic1.jpg
-rw-r--r--  1 publico  544      4.5K nov 14 12:16 pic2.jpg
-rw-r--r--  1 publico  544      4.4K nov 14 12:16 pic3.jpg

```

so, your page could have(--- means start and end, you dont type it, just for delimiting the page):

```

-----
<p>Sales</p>
This is the sales information page. Welcome. <hr>

<p>Sales department information</p>
<padepimg=pic1.jpg>
Check detailed data on our pages:
<padepsub=Sales/Information>Sales information page</padepsub>
<padepsub=Sales/Representatives>Representatives beautiful page</padepsub>.

<p>Links</p>
<padepimg=pic2.jpg>
Check our providers' links:
<padeplnk=www.dodge.com>Dodge Cars</padeplnk>
<padeplnk=www.opel.com>Opel Cars</padeplnk>

<p>Bankrupt</p>
<padepimg=pic3.jpg>
This is the report:
<padepdoc=evaluation.doc>Padep</padepdoc>
-----

```

e) The recursive menu (or directories) structure rebuilds everytime somebody visits the start page. You build the start page on index.php. The frame_left.dat file requires write access on unix, cause it will be written everytime someone visits the home page.

f) Edit config.php file with your data. Check the .php scripts on the web root directory to change everything you want.

Write me (rodolfo.alcazar@padep.org.bo) if anything goes bad. Im a very bad programmer, maybe the code has many errors, so I'll wait for your contributions, and will deserve my eternal gratitude. May The Force Be With You.

Complex install:

a) Close one eye and put andreas wollenweider on the radio

b) go to Easy Install section

Rodolfo
